

ELIMINATOR™ LASER SCOPE™

Eliminator™ LaserScope User's Guide

The Eliminator LaserScope is the most innovative and effective hunting riflescope in the world. Burris combined outstanding optics with pinpoint laser rangefinding and precision trajectory compensation for the exact ammunition you choose for your hunt.

In one fast sequence, the Eliminator ranges the distance to your trophy, calculates the drop of your projectile at that distance, and displays the exact aiming point as a single red dot on the reticle. It eliminates most of the variables

and guesswork that often cause hunters to go home empty handed.

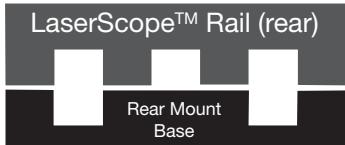

The Eliminator LaserScope is in a league of its own. No other riflescope combines this level of quality, technology, accuracy, repeatability and effectiveness. It will greatly increase the distance at which you can make an ethical shot.

Congratulations, and thank you for choosing the Eliminator by Burris.

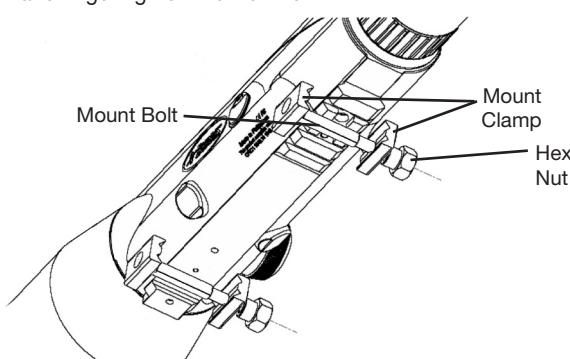

Mounting & Sighting-In

Mounting The Eliminator™ LaserScope

1. Select a Weaver-style or Picatinny-style mounting base. If a two-piece base is selected for a long action bolt rifle, the front base should be a reversible (extension) base which will need to be mounted with the extension directed rearward. We recommend the use of Burris XTB Bases (Xtreme Tactical Bases) as they were also designed with the special mounting considerations of the Eliminator LaserScope.
2. Read the manufacturer's directions regarding the installation of mounts before beginning.
3. Clean the mounting area of the rifle with a chemical that removes grease and oil. Pay special attention to screw holes. Using the same chemical, clean the mounts. Do not allow the cleaning chemical to come in contact with the stock or scope lenses.
4. After installing the base(s), position the scope so it offers the proper eye relief. To do this, shoulder the rifle as you would in the field. Position the scope as far forward as possible while achieving a full field of view.

5. Align one of the rear slots in the Eliminator Rail with one of the slots in the rear mount base and then install the Mount Clamps and Mount Bolt as illustrated below. At this point just finger tighten the Hex Nut.
6. Install the front Mount Bolt through one of the slots in the front base as shown and finger tighten the Hex Nut.

7. With both Hex Nuts slightly loosened, push the scope forward and then firmly tighten both rear and front Hex Nuts.

Eyepiece Focusing

1. Aim the Eliminator LaserScope in a safe direction toward the sky or a light colored wall. Glance through the scope and notice if the reticle is sharply focused. Most users will find that no adjustment is necessary.
2. If the reticle is not in sharp focus, rotate the eyepiece focus ring until the reticle appears in sharp focus. Double check your focus by taking quick glances through the scope and make any fine tuning adjustments as necessary.

Sighting In

Do all shooting in a safe, authorized area. Use proper eye and hearing protection and follow all safe shooting rules. Select the ammunition you intend to use in the field and use it to sight in the firearm.

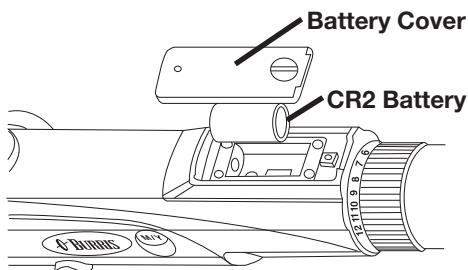

1. Bore sight your scope, OR place a target about two feet square at 25 yards. Fire a shot at the bullseye. Make the necessary adjustments to the Windage and Elevation knobs. Remember, a scope with a click adjustment value of 1/4 inch at 100 yards will require *four* clicks to move the same 1/4 inch distance at 25 yards. Burris scopes have the click value indicated on a label under one of the adjustment caps.
2. Make adjustments on the scope by turning the adjusting screws the necessary number of clicks. NOTE: The reticle (crosshair) is centered at the factory. This permits adjusting the reticle equally in all directions from the center position. Three shot groups are suggested to determine the actual point of impact.
3. After the first group is fired, adjust the scope again. This adjustment should bring the approximate center of the group to coincide with the bullseye. Shoot additional groups as necessary.
4. Place the target at your desired sight-in distance of either 100 or 200 yards. Make the necessary adjustments so your group coincides with the bullseye.
5. Align the dial to read "0" without allowing the silver knob to turn.
6. After making the adjustments, replace the adjustment caps. They protect your scope from dust and moisture.

ELIMINATOR™ LASERSCOPE OPERATION

1. Battery Installation or Replacement

Unload the gun. Use a coin or screwdriver to unscrew the battery cap screw on the top, rear of the scope, just in front of the eye piece. Install a lithium CR2 battery. Reinstall the battery cover. NOTE: A sticker on the underside of the battery contains basic set-up instructions.

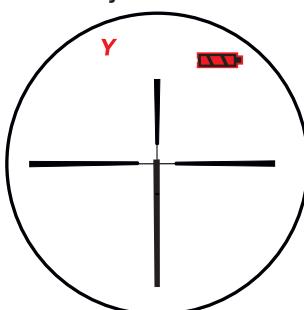

2. LaserScope Battery Life:

Battery life is nominally rated at 5000 cycles. This will vary depending on the quality of the battery and the temperatures at which the unit is operated. Batteries lose a good deal of their power potential in colder temperatures.

- Battery: Full
- Battery: Half Carry a spare
- Battery: Low - Replace the battery

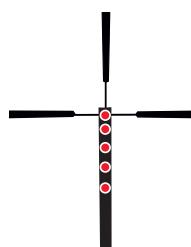

3. Start the electronics

Press the main switch button on the left side of the scope, just behind the Burris logo. Look through the scope. It should show two things: the yards(Y) or meters(M) indication illuminated along with the battery status indicator. The indicators will stay on for 1½ minutes.

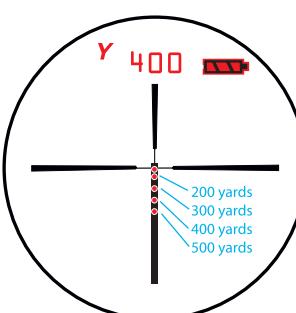

4. Use as a conventional laser ranging scope

Start the electronics and aim at a target. Press either the left side button again or the Remote Activation Switch. The scope will display the horizontal range to your target at the top and also display 5 illuminated dots along the lower cross hair post. These 5 illuminated dots correspond to aiming points on the versatile Ballistic Plex. (Unless a Ballistic Table has been previously set.)

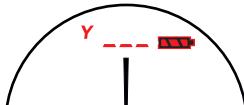

The range displayed is the horizontal distance to the target. The Eliminator LaserScope has a built-in angle sensor and it converts the actual distance to horizontal distance. The horizontal distance is mostly what affects a bullet's trajectory so no matter what the uphill or downhill angle, the Eliminator automatically calculates the distance to use for aiming point selection. The five dots are the hold

points of a conventional Burris Ballistic Plex reticle. You can pick the correct dot for the range and make the shot – OR go to the next section to program your specific cartridge's trajectory curve, which allows the Eliminator LaserScope to provide you ONLY the holdover point, for whatever yardage is displayed.

If the scope fails to get an accurate range reading, it will display a line of three flashing bars.

Remote Transmitter:

The LaserScope comes with a Remote Transmitter to make ranging more convenient. Position the Remote Transmitter on the fore end of a rifle as shown below. It can also be positioned on the Objective Bell of the LaserScope. The LaserScope is Remote-capable for a full 1½ hours every time the Main Switch is depressed.

Remote Transmitter must be located in this area (on either side of the Laser-Scope) within 20 inches of the Remote Receiver

Remote Transmitter Battery:

Common CR2025 battery. Battery life is nominally rated at 5000 cycles. To change, using a finger nail or small screwdriver, pry the back over off of the Remote. For removal, the battery must be tilted and slid out of the holder. Reverse the process for installation of the new battery and snap the back over onto the Remote.

5. Set Up the Eliminator For Your Specific Cartridge

First decision - What Units do you want to work in, Yards or Meters? Y/M

Second decision - Do you want to zero at 100 or 200 Yards / Meters?

Info Needed - Drop in inches of your cartridge at 500 Yards if you zero at 100 Yards (Drop Number).

There are several ways to determine your Drop Number:

1. For factory loads this Guide shows the drop number for most of the currently available factory ammo. See pages 4-7.
2. Factory ammo web sites sometimes provide this information.
3. The drop number may appear on the ammo box.
4. Ballistics Software Programs
5. Actual shooting at 100 yards and at 500 yards.
6. Burris website-www.burrisoptics.com

No matter what units you chose to work in (yards or meters), and **no matter what distance you intend to Zero at, the Ballistic Table is selected based on drop at 500 Yards when zeroed at 100 Yards**. Your 3 digit Ballistic Table will begin with a "1" if you intend to sight-in at 100 yards/meters or a "2" if you intend to sight-in at 200 yards/meters. This number is followed by your Drop Number which will vary between 25 and 63. The complete Ballistic Table will be a number between 125 and 163 or 225 and 263.

Eliminator Essentials

- The trajectory compensation feature is calibrated for use only on 12x magnification.
- The center crosshair must be used for ranging.
- An illuminated aiming dot will remain lit for approximately 80 seconds. If you fail to shoot before the dot goes out, you will need to re-range using the center crosshair.
- There can be several possible causes that result in the Eliminator's inability to determine the distance to a target including: Nearby obstacles between the scope and the target such as grass, twigs, or leaves; Rain, snow, mist or other airborne debris; Dirty objective lens; Poor target quality for reflecting the laser back to the scope coupled with long distances; Low battery.
- If you have programmed the scope for a particular cartridge, and the range to the target cannot be determined, the scope will display three horizontal lines in the yards/meters area, and five illuminated dots that serve as a 'custom' Ballistic Plex that is accurately calibrated to your cartridge.
- If the Eliminator ever seems to be working improperly, there is a good chance that it needs a new battery. First, simply disconnect the existing battery and reinstall and check for function. If this doesn't solve the issue, install a new battery.

Technical Notes

Fine Tuning and Altitude

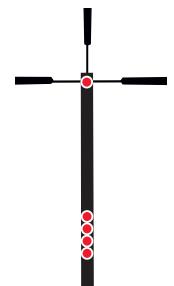

Ammo makers generally state their bullet drop numbers at sea level. Very generally, big game hunting bullets drop at 500 yards about $\frac{1}{2}$ inch less for each additional 1000 feet of elevation. So, if you going to hunt at 6,000 feet elevation and your ammo box says you should have 40 inches of drop at 500 yards with a 100 yard zero, then you would want to select the Ballistic Number 37 instead of 40. Our website www.burrisoptics.com contains charts showing more specific altitude adjustments for each cartridge. Other ballistics software programs can also provide you even more precise information.

Depending on the exact ammo performance, your gun's barrel length, the elevation, and any extreme temperatures, you might need to increase or decrease your Ballistic Table by a couple of digits for exacting performance. Ballistics software programs are of great benefit to get you close, but nothing beats firing five shot groups with the actual ammo at 500 yards to provide you with the most precise information possible in order to perfectly program your Eliminator Laserscope.

Extreme Range Shooting (Beyond 500 yards)

The factors that influence a bullet in flight at extreme range are many and their relationships are complex.

The BC (Ballistic Coefficient) of your bullet is a factor that describes how fast the bullet slows down. The ACTUAL BC of a bullet and the PUBLISHED BC can be different and can affect your Ballistic Table. In developing the simple-to-use programming, Burris leaned more towards the premium ammunition with premium bullets. For all practical purposes, from 100 to 500 yards, the way the Eliminator Laserscope works there exists very little bullet flight error from one bullet to another. The BC values of most available bullets are on our website. However, going beyond 500 yards, there can be sizable differences in actual point of impact depending on the BC of the bullet you are using. The chart on page 8 lists the actual BC numbers used for each Ballistic Table. To take full and simple advantage of The Eliminator Laserscope for shooting beyond 500 yards, one would be wise to use a bullet that closely matches the values we represent in the chart. **Also, when the Eliminator Laserscope gets a distance reading that is beyond the capability of the reticle's drop compensation, the bottom four dots will light up signifying to you that the target is beyond the reticle's capability.**

Specifications

Operating Temperature:

+14° to +122° fahrenheit

-10° to +50° celsius

Storage Temperature:

-13° to +158° fahrenheit

-25° to +70° degrees celsius

Effective Range:

Deer: 50 yards to 550 yards

Reflective Target: 50 yards to 800 yards

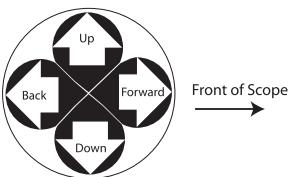

Ranging Accuracy:

Less than 100 yards: +/- 1 yard

100 - 550 yards: +/- 2 yards

More than 550 yards: +/- 3 yards

There are four arrows on the Setup button on the right side of the scope. These are used only for programming. They have no function during normal use of the scope.

Enter Set-Up Mode

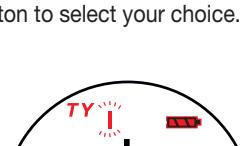

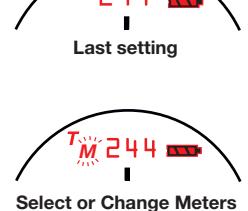

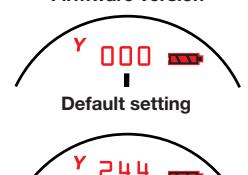

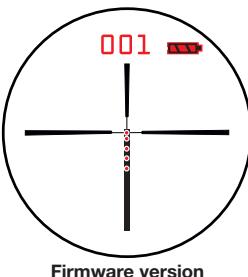

- Turn on the scope.
- Then press and hold the Main Switch button and the Forward Arrow on the Setup button (at the same time) for six seconds. Looking through the scope, you will see a change in the display. Release the two buttons when the display changes. This is called "Setup Mode". First a number appears for two seconds. That number is the firmware version. Next the display shows the currently selected (Y)ards or (M)eters and Ballistic Table. On new scopes the reading will be "Y 000" which is the default table. If a Ballistic Table has been previously selected, the designation for that Table is displayed.
- With the currently selected table displayed you have 30 seconds to click the Forward Arrow button to enter the Ballistic Table select mode. The "T" (for table select) is lit steady, the Unit (Y or M) is flashing. Press the Up Arrow to select Y (yards) or the Down Arrow to select M (meters). When you have the measurement unit you want flashing, press and release the Forward Arrow button to select your choice.
- The "T" is still on steady, your unit is on and steady, your first numeric digit is flashing, and the other two are out. Select your Zero Distance - 0 (= default table only), 1 (= 100 Yards/Meters), or 2 (= 200 Yards/Meters). Press the Up Arrow to increase the number or the Down Arrow to decrease it. When your preferred sight-in distance is displayed (flashing), press and release the Forward Arrow button.
- The last two numbers (for your Drop Number or Ballistic Table) should be flashing. Press the Up Arrow to increase the number, or the Down Arrow to decrease it. When the Drop Number you want is displayed (flashing), press and release the Back Arrow button to exit the Set-Up mode.
- You are ready to go shooting. Re-zero the gun if necessary at your selected sight-in distance. Then verify point of impact by actual shooting at 500 yards. Depending on the exact ammo performance, your gun's barrel length, the elevation, and any extreme temperatures, you might need to increase or decrease your Ballistic Table by a couple of digits for exacting performance.

Your programming is stored in the scope no matter the condition of your battery and it will still remember your programming with no battery at all.

Understanding The Ballistic Table Display:

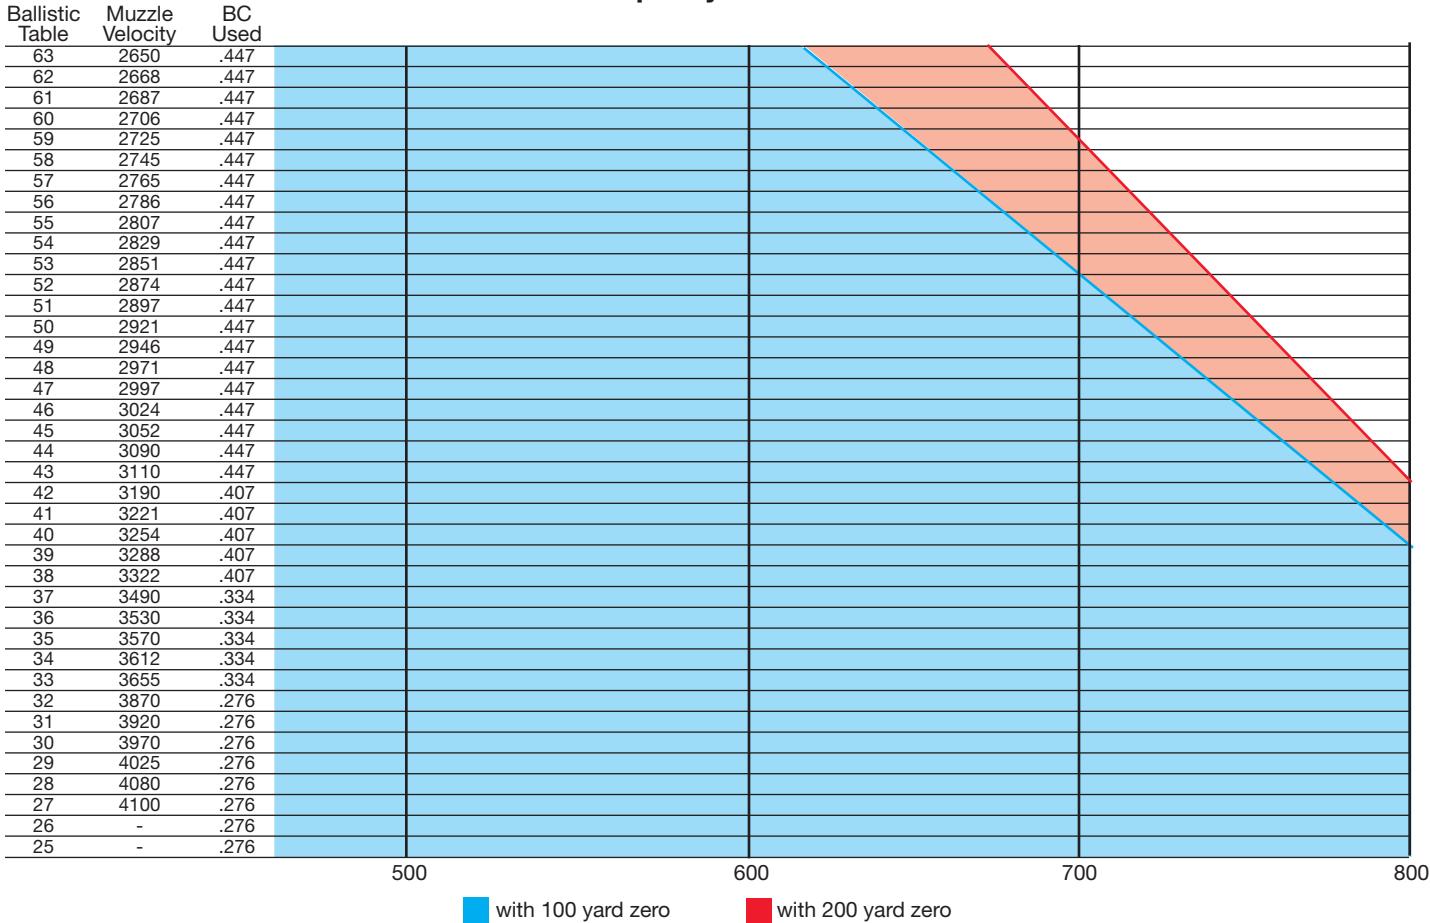

Ballistic Table M234 means: (M)eters, 200Meter Zero, a cartridge with 34 inches of drop at 500 yard when zeroed at 100 yards.

Ballistic Table Y157 means: (Y)ards, 100Yard Zero, a cartridge with 57 inches of drop at 500 yards when zeroed at 100 yards.

Cartridge	Brand	Wt	Bullet	"100 Zero, 500 Yard		Drop Number.	"100 Zero, 500 Yard		Drop Number.

Eliminator Reticle Holdover Capability based on the chosen Ballistic Table

Checklist before returning a scope

A significant number of scopes are returned to Burris each year that are found to function perfectly. To avoid unnecessary delays and expenses we encourage you to check for the following conditions.

Insufficient windage adjustment

1. Base mounting holes drilled out of alignment with center of bore
2. Barrel threaded into receiver at an angle

Insufficient elevation adjustment

1. Receiver diameter out of specification
2. Barrel threaded in at an angle

Grouping or accuracy

1. Barrel or chamber throat erosion
2. Stock warpage
3. Stock Bedding problem
4. Loose mount
5. Heavy trigger pull Solution - Consult with a gunsmith

Focus or image not clear

1. Object too close
2. Eyepiece out of focus

When returning the scope be sure to include:

1. Make yourself a note of your scope's serial number for use when calling to check on your in-service scope.
2. Complete name and full address.
3. A short note describing the nature of the problem as accurately as possible.
4. Ship the scope prepaid and Insured by mail, UPS, or other parcel service. Burris can't be responsible for your scope until we physically receive it. Burris pays for shipping back to you.
5. Insure the shipment against loss.

Send the scope to the following address:

Burris Company, Inc.
331 E. 8th Street
Greeley, Colorado 80631

For additional information about riflescope operations, go to the 'Burris University' section of our website: www.burrisoptics.com

Storage:

As with any electronic device, it is always a good idea to remove the battery when storing for a long period of time. During storage or transportation, be sure that the Main Switch on the Eliminator and the button on the Remote Transmitter are not inadvertently depressed thereby running the battery down when not in use.

Scope Use, Service, & Care

Your Burris scope will provide a lifetime of service if given the reasonable care and treatment it deserves. The only maintenance required is occasional cleaning of the outside of the scope and the exterior lenses.

All moving assemblies are permanently lubricated. Use lens covers to protect the scope from dirt, dust, lint, and moisture. The adjustment system is waterproof even without the turret caps in place, but keep these caps tight to keep dust and dirt out of the mechanical system. Before cleaning the lenses, brush them with a photographer's brush or blow them clean, ideally with "canned air". This removes large particles which can scratch the surface if wiped under pressure. Never disassemble your scope. Disassembly by anyone other than our factory will void the warranty.

Burris Warranty

If your LaserScope's optics or mechanical systems are ever found to have defects in materials or workmanship, Burris will, at our option, repair or replace it at no charge. The ranging system and electronics are warranted for 3 years from the date of purchase. If a repair is needed, send the product to Burris Company, 331 East 8th Street, Greeley, Colorado, 80631.

Shipping charges to Burris must be prepaid by the owner. Insure the shipment. Burris can't be responsible for your product until we receive it. There are no other warranties, either expressed or implied, contained herein except for such that may arise under certain state laws. In that event, said implied warranties are limited in scope and duration to the terms of this warranty. Burris is not liable for incidental or consequential damages including but not limited to lost profits or other economic or commercial losses. This warranty gives the owner certain legal rights, and possibly other rights which may vary from state to state. Under the guidelines of the Consumer Protection Agency, this is considered a limited warranty.
